

1 **ABSTRACT OF THE DISCLOSURE**

2 A safety switch for a water dispenser includes a knob adapted to be rotatably
3 mounted on the pushbutton and having an extension integrally formed with the knob and
4 an abutting plate formed on an outer periphery of the extension, and a stop adapted to be
5 integrally formed on an inner face of the panel to correspond to and engage with the
6 abutting plate so as to prevent the movement of the pushbutton. After the rotation of the
7 knob to misalign the abutting plate with the stop, the pushbutton is able to be pressed to
8 release water from the water dispenser.
